

In the Claims:

Please cancel claim 1 to 12 without prejudice and add new claims 13 to 23 as follows:

Claims 1 to 12.(canceled)

13.(new) A device (1) for a hair dryer (2), said device comprising means for generating a central hot-air stream (5) and a concentric cold-air stream (6);

wherein said means for generating the central hot-air stream (5) and the concentric cold-air stream (6) comprises a fan (3), a heater (4) and a detachable air nozzle attachment (8) that is connectable over a blower opening (7); and

wherein said detachable air nozzle attachment (8) comprises a flat hot-air nozzle (13), a flat cold-air nozzle (14) arranged side-by-side with one side of the flat cold-air nozzle against one side of the flat hot-air nozzle and means (18) for releasable attachment of the detachable air nozzle attachment (8) over the blower opening (7) so that the concentric cold-air stream (6) passes through the flat cold-air nozzle and the central hot-air stream (5) passes through the flat hot-air nozzle to produce side-by-side streams of hot and cold air (9,10) and so that the air nozzle attachment (8) is rotatable when attached over the blower opening (7).

14.(new) The device as defined in claim 13, wherein the air nozzle attachment (8) is provided with a central conduit entrance (11) for the flat hot-air nozzle (13) and with a coaxial conduit entrance (12) for the flat cold-air nozzle (14), so that the central hot-

air stream passes through the central conduit entrance (11) into the flat hot-air nozzle and the concentric cold-air stream passes through the coaxial conduit entrance (12) into the flat cold-air nozzle.

15.(new) The device as defined in claim 13, wherein the air nozzle attachment (8) is made of heat-resistant plastic (19).

16.(new) The device as defined in claim 13, wherein outer regions of the flat hot-air nozzle (13) and of the flat cold-air nozzle (14) have respective different appearances.

17.(new) The device as defined in claim 16, wherein an outer section (20) of the flat hot-air nozzle (13) has a red color, and an outer section (21) of the flat cold-air nozzle (14) has a blue color, so that the flat hot-air nozzle (13) and the flat cold-air nozzle (14) are distinguishable by visual observation.

18.(new) The device as defined in claim 13, wherein the means (18) for releasable attachment of the air nozzle attachment (8) comprises a releasable snap-on connection (18) for rotatable attachment of the air nozzle attachment (8) over the blower opening (7).

19.(new) The device as defined in claim 13, wherein the flat hot-air nozzle (13) and the flat cold-air nozzle (14) have at least approximately equal blower cross-sections (16,17).

20.(new) The device as defined in claim 13, wherein the flat hot-air nozzle (13) has a smaller blower cross-section (16) than a blower cross-section (17) of the flat cold-air nozzle (14).

21.(new) The device as defined in claim 13, wherein the flat hot-air nozzle (13) and the flat cold-air nozzle (14) are substantially coterminous.

22.(new) The device as defined in claim 13, further comprising means for providing only a single stream (9) of hot air, said means for providing the single stream (9) of hot air comprising another detachable air nozzle attachment (23) through which the single stream of hot air passes and means for blocking a cold air flow when said another detachable air nozzle attachment (23) is attached over the blower opening (7);

whereby said detachable air nozzle attachment (8) or said another detachable air nozzle attachment (23) is attached over the blower opening (7) in operation according to choice by a user of the hair dryer.

23.(new) A hair dryer comprising:

a device for generating a central hot-air stream and a concentric cold-air stream or only a single stream of hot air, said device comprising a fan (3) and a heater (4);

a first detachable air nozzle attachment (8) that is attachable over a blower opening (7), said first detachable air nozzle attachment (8) comprising a flat hot-air nozzle (13), a flat cold-air nozzle (14) arranged side-by-side with one side of the flat cold-air nozzle against one side of the flat hot-air nozzle and means (18) for releasable attachment of the first detachable air nozzle attachment (8) over the blower opening (7), so that the cold-air stream passes through the flat cold-air nozzle and the hot-air stream passes through the flat hot-air nozzle to produce side-by-side streams of hot and cold air (9,10), said means (18) for releasable attachment permitting rotation of the first detachable air nozzle attachment (8) when said first detachable air nozzle attachment (8) is attached over the blower opening; and

a second detachable air nozzle attachment (23) through which the single stream of hot air passes and comprising means for blocking a cold air flow from the second detachable air nozzle attachment (23) when said second detachable air nozzle attachment is attached over the blower opening;

whereby either the first detachable air nozzle attachment (8) or the second detachable air nozzle attachment (23) is attached over the blower opening in operation according to choice by a user of the hair dryer.
